                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         235
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            355
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cancer etiology. However, along was not a useful gene to study in cancer etiology. However, alternative initiation exons of the ingl gene, each having their own promoter have been discovered. Expression of one promoter (1a) produces a protein identical to ING1. Expression of a second promoter (1b) produces a protein having an identical C-terminal fragment to ING1 but an additional 104 converninal amino acids. The newly discovered protein has been designated p371NG1 (Wild type: p331NG1). p371NG1 has the characteristics of an oncogene. When overexpressed in cells (even those expressing wild type p53) p371NG1 is able to cause those expressing wild type p53) p371NG1 is able to cause proliferation or transformation of those cells. Thus detecting a nucleic acid encoding exon 1b of ing1 by hybridisation with an cultication or transformation of those cells. Thus detecting a nucleic acid having the sequence of exon 1b of ing1 by hybridisation with an or its antisense sequence can identify individuals expressing the oncogenic form of ing1. Novel peptide sequences taken from the 104 con also be used in detection methods for the p371NG1 variant. The polypeptides may be useful in gene therapy for treatment of cell proliferation disorders, especially cancers and for diagnosing and
                                                                                                                                                                                               Detecting nucleic acid encoding exon 1b of ing1, useful for diagnosing and treating cancer, comprises contacting sample with isolated nucleic acid comprising sequence of exon 1b and detecting hybridized products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    176 TCGCTGCCCCACGACATGCAGAACGTGTCTGTGCTGCGAGAGCTGGACAAATAT

                                                                                                                                                                                                                                                                                                                                                                                            The P53 pathway occurs in a much larger proportion of tumours. In many cases the mechanism of functional inactivation of the p53 gene instances the mechanism of functional inactivation of the p53 gene instances the mechanism of functional inactivation of the p53 gene instances of more p53 has been found to act in cooperation with ING1. Functional cooperation between ING1 and p53 suggested that ING1. Encoded a tumour suppressor protein that functioned within the p53 pathway. This data suggested a possible role for ING1 in head and neck cancers and chromosomal location of the ING1 placed it within a region that is frequently rearranged in head and neck cancers. Large scale analysis of tumours involving ING1 has not revealed mutations in ING1 nor significant variations in its expression suggesting that ING1 was soft a useful gene to study in
                                                                                                                                                                                                                                                                                                                                               Mutations in or loss of the p53 gene occur in more than 50% of human tumours and tumour cell lines, but functional inactivation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               23.5%; Score 253.6; DB 21; Length 2817;

145 265 476 445 264 205 324 384 325 444 385 534 594 565 654 human tumours and tumour cell lines, but functional inactivation of the p53 pathway occurs in a much larger broportion of tumours. In many cases the mechanism of functional inactivation of tumours. In nany cases the mechanism of functional thactivation of tumours. In remains unknown but p53 has been found to act in cooperation with ING1 encoded a tumour suppressor protein that functioned within the p53 pathway. This data suggested a possible role for ING1 in head and neck cancers and chromosomal location of the ING1 placed it within a region that is frequently rearranged in head and neck cancers. Large scale analysis of tumours involving ING1 has not revealed mutations in ING1 nor significant variations in its cancer etiology. However, alternative initiation exons of the ing1 gene, each having their own promoter have been discovered. Expression of one promoter (la) produces a protein having an identical C-terminal fragment to ING1 but an additional 104 N-terminal anino acids. The newly discovered protein has been classificated p37ING1 (wild type: p33ING1). p37ING1 has the characteristics of an oncogene when overexpressed in cells (even those expressing wild type: p33ING1). p37ING1 has the collect acid encoding exon 1b of ing1 by hybridisation with an isolated nucleic acid having the sequence of exon 1b of ing1 the sequen 266 GCAGCGCGCGCTGATCCGCAGCCAGGAGCTGGGCGACGAGAAGATCCAGATCGTGAGCCA 385 AATGCTCGAATTGGTGGAAAATCGGGCAAGACAAATGGAGTTACACTCACAGTGTTTTCCA -----CTGCTGAAAGTGAACGAGCCTCAGATA GCCCCAGCAGCAGCTGGGCGACACAGGCGCAACAGCGGCAAGGTTGGCGGGAACAGCCC 86 CTATGTGGAGGACTACCTGGACTCCATCGAGTCCCTGCCTTTCGACTTGCAGAAATGT GTCTGTGCTGCGAGAGCTGGACAACAAATATCAAGAAACGTTAAAGGAAATTGATGATGT AAGCAAAGATGGATTCCAGCCAACCAGAAAGATCTTCAAGAAGACCCCGCAG--GCAGCG 446 CAATGGCGATGCGCTAGCGCAGTCTGACAAGCCCCAACAGCAAGCGCTCACGGCGGCAGCG GACCAGTGAAAGCCCGTGATTTATGTCACATGGCAAATGGGATTGAAGACTGTGATGATCA 506 CAACAACGAGAACCGTGAGAACGCGTCCAGCAACCACGACGACGACGGCGCCTCGGG CTACGAAAAATATAAGAAAGAAGATGATTTAAAACCAGAAGAAACGTCTACAGCAGCTTCT 206 CTACGAGCGCTTCAGTCGCGAGACAGACGGGGCGCAGAAGCGGCGGATGCTGCACTGTGT CTACGTGCAGGACTACCTTGAGTGCGTGGAGTCGCTGCCCCACGACGATGCAGAGGAACGT Gaps han 50% of inactivation of or its antisense sequence can identify individuals expressing the oncogenic form of ingl. Novel peptide sequences taken from the 104 Noterninal peptide of p37ING1 can also be used to raise antibodies that can also be used in detection methods for the p37ING1 variant. The present sequence encodes a human cancer associated antigen. The sequence is a variant of the ING1 gene, which is a tumour suppressor gene candidate. The cancer associated antigen polynucleotides and polypeptides are useful for screening for the possible presence of a pathological condition in a subject such as cancer. The cancer associated antigen polypeptides are useful for producing vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          쉽
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention discloses monoclonal antibodies which can be used, in combination, to specifically recognise epitopes of ING1 (inhibitor of growth 1) protein isoforms. ING1 is a tumour suppressor gene and its expression is regulated through the cell cycle, peaking in the S phase. Expression of ING1 is down regulated in breast tumours and lymphoid malignancies. Overexpression of a construct containing the ING1 eners is able to inhibit cell growth by reducing the fraction of cells which enter ing protein in a cell, which involves selecting a cells that ectopically or endogenously expresses ING1 protein. The anti-ING1 monoclonal antibody combination consists of two or more antibodies of CAbi-CAbi0 (not defined), preferably a mixture of CAbi-CAb4, which can detect at least two different isoforms of ING1. The antibodies are also useful for diagnosing a disease e.g. tumour or medical condition in an animal corferably, human) associated with aberrant levels of an ING1 protein. The sequence presented is the human inhibitor of growth 1 (ING1) isoform, protein used to raise antibodies.
                                                                                                                                                               Human; gene; ss; monoclonal antibody; epitope; inhibitor of growth 1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GCCGGGTACTGCACCACCAGAGGGCCCTGATCGCAGCGAGGAGCTAGGCGATGAGA 126
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nutations in or loss of the p53 gene occur in more than 50% of human tumours and tumour cell lines, but functional inactivation of human tumours and tumour cell lines, but functional inactivation of tumours. In many cases the mechanism of functional inactivation of the p53 gene remains unknown but p53 has been found to act in cooperation with remains unknown but p53 has been found to act in cooperation with right expectation between ING1 and p53 suggested that ING1. Functional cooperation between ING1 and p53 suggested that ING1. Functional cooperation between ING1 and p53 suggested that ING1 encoded a tumour suppressor protein that functioned within the p53 pathway. This data suggested a possible role for ING1 in head and neck cancers and chromosomal location of the ING1 placed it within a region that is frequently rearranged in head and neck cancers. Large scale analysis of tumours involving ING1 has not within a region that ING1 mas not a useful gene to study in cancer ethology. However, alternative initiation exons of the ing1 expression of one promoter (1a) produces a protein identical canch maying their own promoter have been discovered. Expression of one promoter (1b) produces a protein having ency each maying their own promoter (1b) produces a protein having the network at a second promoter (1b) produces a protein having the network of second promoter (1b) p37ING1 has the designated p37ING1 (wild type ip 331ING1). p37ING1 has the characteristics of an oncogene. When overexpressed in cells (even those expressing wild type p33 p7ING1 is able to cause proliferation or transformation of those cells. Thus detecting a proliferation or transformation of those cells. Thus detecting a solated mucleic acid having the sequence of exon 1b of ing1 or its antisense sequence can identify individuals expressing the concepenic form of ing1. Novel peptide sequences taken from the 104 or that can also be used in detection methods for the p37ING1 wariant. The polypeptides may be useful in gene therapy for treatment of call
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         7 TGAAGGAGCTGGACGACTACTATGAGAAGTTCAAACGGGAACAGGACGGCACCCAGAAAGC 66

                                                                               The sequence is the wildtype of the ING1 gene, which is a tumour suppressor gene candidate. The cancer associated antigen polynucleotides and polypeptides are useful for screening for the possible presence of a pathological condition in a subject such as cancer. The cancer associated antigen polypeptides are useful for producing vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CCAGAGAGCGGCGGATGCTGTGTGTGCAGCGCGCGCGCTGATCCGCAGCAGGAGCTGG

                                                                                                                                                                                                                                                                                                                                                         hybridisation between normal mammary and transformed epithelial CDNAs, isolation of an antisense ING1 CDNA insert that caused increased cell proliferation, and use of the insert to screen normal human fibroblast and HeLa CDNA libraries. A complete ING1 sequence (AAT69652) was obtd. by 5'RACE. ING1 is localised to the 13q33-34 chromosome region, to which a number of human cancers have been mapped. ING1 nucleic acids can be used in the diagnosis of breast cancer; a decreased level of ING1 mRNA indicates cancerous cells. They can also be used in gene therapy methods to block the
                                                                                     Isolated tumour suppressor gene, ING1 - useful to develop products for inhibiting or increasing cell proliferation, in particular for treatment or diagnosis of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 183.8; DB 18; Length 1902;

This is the nucleotide sequence of a human ING1 (INhibitor of Growth) partial cDNA clone that codes for a pi33ING1 polypeptide (see AAW9674), a novel inhibitor of cell growth and a candidate tumour suppressor. ING1 is a new gene that is expressed in normal mammary epithelial cells, but which is expressed only at lower levels in several cancercus mammary epithelial cell lines and is not expressed in many primary brain tumours. To isolate ING1, a subtractive hybridisation of breast cancer cell line cDNAs was performed with CDNA from normal mammary epithelial cells, and subtracted cDNAs were cloned into retrovirus vector piNCX. Following passage through a packaging line, normal mouse mammary epithelial cells, and subtracted cDNAs were infected, and infected cells were infected into nude mice. Putative transforming fragments from tumours were isolated by PCR (see AAV62290-91) and subcloned into LNCX. An ING1 fragment was obtained and used to screen normal human fibroblast and HeLa cell cDNA libraries. 2 clones were sequenced to obtain the partial ING1 sequence. The complete cDNA sequence (see AAV62292) was obtained by RACE.   A full-length cDNA clone (AAT69652), designated ING1, codes for a novel 33 kDa tumour suppressor protein p33ING1 (AAM19119), formerly p33IG1, that is a potent inhibitor of cell growth. A partial clone (AAT69651) was isolated by subtractive hybridisation between normal mammary and transformed epithelial cDNAs, isolation of an antisense ING1 cDNA insert that caused increased cell proliferation, and use of the insert to screen normal human fibroblast and HeLa cDNA libraries. The complete ING1 sequence was then obtd. by 5'RACE. ING1 is localised to the 13q33-34 chromosome region, to which a

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

It currently consists of 8 configs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will

NOTE: This is a 'working draft' sequence. It currently consists of 50 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as'it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                           Submitted (19-JUL-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor Polage of Medicine, One Baylor Plaza, Houston, TX 77030, USA

It currently consists of 26 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTE: This is a 'working draft' sequence. It currently consists of 69 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                      length
